Caixa Do Correio N. 65

Dear Dr. Pessôa:

I received both the set of reprints and Xerox copies of your articles. Thank you very much for your trouble. We have done a survey of hemogregarines in the blood of snakes in the state of Arkansas. There appears to be new form, not previously described in the United States, in the blood of a black rat snake, Elaphe obsoleta obsoleta. Therefore it is important for me to also cover the international literature as well. This form will be discussed in an abstract to be given at the annual meeting of the American Society of Parasitologists this November in New Orleans. If you will be in attendance, I hope that we can get together.

Sincerely,

James J. Daly, Ph.D.
Associate Professor
